3 Introduction

Decomposing a system into modules is a commonly accepted approach to developing software. A module is a work assignment for a programmer or programming team (Parnas et al., 1984). We advocate a decomposition based on the principle of information hiding (Parnas, 1972). This principle supports design for change, because the "secrets" that each module hides represent likely future changes. Design for change is valuable in SC, where modifications are frequent, especially during initial development as the solution space is explored.

Our design follows the rules laid out by Parnas et al. (1984), as follows:

- System details that are likely to change independently should be the secrets of separate modules.
- Each data structure is implemented in only one module.
- Any other program that requires information stored in a module's data structures must obtain it by calling access programs belonging to that module.

After completing the first stage of the design, the Software Requirements Specification (SRS), the Module Guide (MG) is developed (Parnas et al., 1984). The MG specifies the modular structure of the system and is intended to allow both designers and maintainers to easily identify the parts of the software. The potential readers of this document are as follows:

- New project members: This document can be a guide for a new project member to easily understand the overall structure and quickly find the relevant modules they are searching for.
- Maintainers: The hierarchical structure of the module guide improves the maintainers' understanding when they need to make changes to the system. It is important for a maintainer to update the relevant sections of the document after changes have been made.
- Designers: Once the module guide has been written, it can be used to check for consistency, feasibility, and flexibility. Designers can verify the system in various ways, such as consistency among modules, feasibility of the decomposition, and flexibility of the design.

The rest of the document is organized as follows. Section 4 lists the anticipated and unlikely changes of the software requirements. Section 5 summarizes the module decomposition that was constructed according to the likely changes. Section 6 specifies the connections between the software requirements and the modules. Section 7 gives a detailed description of the modules. Section 8 includes two traceability matrices. One checks the completeness of the design against the requirements provided in the SRS. The other shows the relation between anticipated changes and the modules. Section 9 describes the use relation between modules.

4 Anticipated and Unlikely Changes

This section lists possible changes to the system. According to the likeliness of the change, the possible changes are classified into two categories. Anticipated changes are listed in Section 4.1, and unlikely changes are listed in Section 4.2.

4.1 Anticipated Changes

Anticipated changes identified below are small modifications to already existing modules. Ideally, implementing one of the anticipated changes will only require changing a single module. The Utrition team has specifically taken designing for change into account when creating modules.

AC1: The specific hardware on which the software is running.

AC2: The format of the initial input data.

AC3: The graphics being displayed on the user interface.

AC4: The nutritional data details of a food to be displayed.

AC5: The dataset used to train the image classification model.

4.2 Unlikely Changes

Unlikely changes to Utrition are listed below. These modifications are not expected to be implemented based on their unnecessary nature and difficulty of implementation. If any of these changes are implemented, many parts of the design will potentially need to be modified. Hence, it is not intended that these decisions will be changed.

UC1: Input/Output devices (Input: File and/or Keyboard, Output: File, Memory, and/or Screen).

UC2: There will always be a source of input data external to the software.

UC3: Local storage of the user's past nutritional history.

5 Module Hierarchy

This section provides an overview of the module design. Modules are summarized in a hierarchy decomposed by secrets in Table 1. The modules listed below, which are leaves in the hierarchy tree, are the modules that will actually be implemented.

M1: Application Path Module

M2: Home Page Module

M3: Profile Page Module

M4: Nutrition Log Module

M5: Upload Page Module

M6: Upload Container Module

M7: Image Upload Module

M8: Text Upload Module

M9: Voice Upload Module

M10: Navigation Bar Module

M11: Input Pre-Processing Module

M12: Training Dataset Module

M13: Image Classification Module

M14: Nutritional Data Retriever Module

M15: Profile Data Calculation Module

Level 1	Level 2
Hardware-Hiding Module	N/A
	Application Path Module
	Home Page Module
	Profile Page Module
Behaviour-Hiding Module	Nutrition Log Module
	Upload Page Module
	Upload Container Module
	Image Upload Module
	Text Upload Module
	Voice Upload Module
	Navigation Bar Module
	Input Pre-Processing Module
Software Decision Module	Training Dataset Module
	Image Classification Module
	Nutritional Data Retriever Module
	Profile Data Calculation Module

Table 1: Module Hierarchy

6 Connection Between Requirements and Design

The design of the system is intended to satisfy the requirements developed in the SRS. In this stage, the system is decomposed into modules. The connection between requirements and modules is listed in Table 2.

7 Module Decomposition

Modules are decomposed according to the principle of "information hiding" proposed by Parnas et al. (1984). The Secrets field in a module decomposition is a brief statement of the design decision hidden by the module. The Services field specifies what the module will do without documenting how to do it. For each module, a suggestion for the implementing software is given under the Implemented By title. If the entry is OS, this means that the module is provided by the operating system or by standard programming language libraries. Utrition means the module will be implemented by the Utrition software.

Only the leaf modules in the hierarchy have to be implemented. If a dash (-) is shown, this means that the module is not a leaf and will not have to be implemented.

7.1 Hardware Hiding Modules

Secrets: The data structure and algorithm used to implement the virtual hardware.

Services: Serves as a virtual hardware used by the rest of the system. This module provides the interface between the hardware and the software. So, the system can use it to display outputs or to accept inputs.

Implemented By: OS

7.2 Behaviour-Hiding Module

Secrets: The contents of the required behaviours.

Services: Includes programs that provide externally visible behaviour of the system as specified in the software requirements specification (SRS) documents. This module serves as a communication layer between the hardware-hiding module and the software decision module. The programs in this module will need to change if there are changes in the SRS.

Implemented By: Utrition

7.2.1 Application Path Module (M_1)

Secrets: The structure of the application.

Services: Imports all used React component to structure the basic interface of each page based on the path of the website.

Implemented By: Utrition

Type of Module: Record

7.2.2 Home Page Module (M2)

Secrets: Displays all information needed on the Home Page.

Services: Imports components relevant to the Home Page to organize all components on the page.

Implemented By: Utrition

Type of Module: Abstract Object

7.2.3 Profile Page Module (M3)

Secrets: Displays all information needed on the Profile Page.

Services: Imports components relevant to the user's profile statistics to organize all components on the Profile Page.

Implemented By: Utrition

Type of Module: Abstract Object

7.2.4 Nutrition Log Module (M4)

Secrets: Displays the user's past inputs and their nutritional facts.

Services: Formats the data to be viewed in a visually pleasing manner on the Profile Page once imported from the Profile Page module.

Implemented By: Utrition

Type of Module: Library

7.2.5 Upload Page Module (M6)

Secrets: Displays all objects needed on the Upload Page.

Services: Imports components required to upload data, and organizes all components within the page.

Implemented By: Utrition

Type of Module: Abstract Object

7.2.6 Upload Container Module (M7)

Secrets: Provides interface to allow the user to log their meal by uploading an image.

Services: Imports components relevant to image upload, text upload, and voice upload to organize all components on the page.

Implemented By: Utrition

Type of Module: Abstract Object

7.2.7 Image Upload Module (M8)

Secrets: Provides interface to allow the user to log their meal by uploading an image.

Services: Formats input and queries backend regarding the nutritional contents of the classified food.

Implemented By: Utrition

Type of Module: Abstract Object

7.2.8 Text Upload Module (M9)

Secrets: Provides interface to allow the user to log their meal by manual, textual entry of their meals.

Services: Formats input and queries backend regarding the nutritional contents of the specified food.

Implemented By: Utrition

Type of Module: Abstract Object

7.2.9 Voice Upload Module (M10)

Secrets: Provides interface to allow the user to log their meal by verbal communication of their meals.

Services: Formats input and queries backend regarding the nutritional contents of the classified food.

Implemented By: Utrition

Type of Module: Abstract Object

7.2.10 Navigation Bar Module (M11)

Secrets: Provides interface to allow the user to navigate through various pages of the application.

Services: Changes the path of the website to render a new page based on a user action.

Implemented By: Utrition

Type of Module: Abstract Object

7.3 Software Decision Module

Secrets: The design decision based on mathematical theorems, physical facts, or programming considerations. The secrets of this module are *not* described in the SRS.

Services: Includes data structure and algorithms used in the system that do not provide direct interaction with the user.

Implemented By: Utrition

7.3.1 Input Pre-Processing Module (M12)

Secrets: Converts an image path into a pixel array that can be used for machine learning processes in the Image Classification Module.

Services: Converts the input file path to a pixel array formatted as a multidimensional array of integers through accessing the image at the file path and concatenating its pixel values.

Implemented By: Utrition

Type of Module: Library

7.3.2 Training Dataset Module (M13)

Secrets: Creates a dictionary of known food identifiers for use by machine learning processes in the Image Classification Module.

Services: Produces a dictionary of image labels and classes for use in the machine learning code contained in the Image Classification Module. This is done by parsing the training image, test image, and metadata files and appending the pixel array of the input image.

Implemented By: Utrition

Type of Module: Library

7.3.3 Image Classification Module (M14)

Secrets: Identifies the food present in a user image.

Services: Converts the input image pixel array to a string classification of the food in the image through a machine learning model.

Implemented By: Utrition

Type of Module: Library

7.3.4 Nutritional Data Retriever Module (M15)

Secrets: Retrieves nutritional information for an inputted food item.

Services: Using the input food item, a request is made to NutritionixAPI to fetch the

nutritional data of this item.

Implemented By: Utrition

Type of Module: Library

7.3.5 Profile Data Calculation Module (M16)

Secrets: Stores all past user inputted food items and their nutritional facts.

Services: Every user inputted food item and their corresponding nutritional facts are stored

in a sequence of FoodEntry objects.

Implemented By: Utrition

Type of Module: Abstract Data Type

8 Traceability Matrix

This section shows two traceability matrices: between the modules and the requirements and between the modules and the anticipated changes. The requirements include functional and non-functional requirements that are outlined in the SRS.

9 Use Hierarchy Between Modules

In this section, the uses hierarchy between modules is provided. Parnas (1978) said of two programs A and B that A uses B if correct execution of B may be necessary for A to complete the task described in its specification. That is, A uses B if there exist situations in which the correct functioning of A depends upon the availability of a correct implementation of B. Figure 1 illustrates the use relation between the modules. It can be seen that the graph is a directed acyclic graph (DAG). Each level of the hierarchy offers a testable and usable subset of the system, and modules in the higher level of the hierarchy are essentially simpler because they use modules from the lower levels.
